Rear wheel: simulation versus replay 1 — 2026-10-29 15:27:21

Same ordered model_2500 torque targets · source episode 12.5–17.5 s
Airborne hardware, nominal C0 50 Hz (49.57 Hz measured) · saved nominal fixed-base Isaac400
Core duration: simulation 5.000 s; hardware 5.043 s · no fitted delay or time rescaling

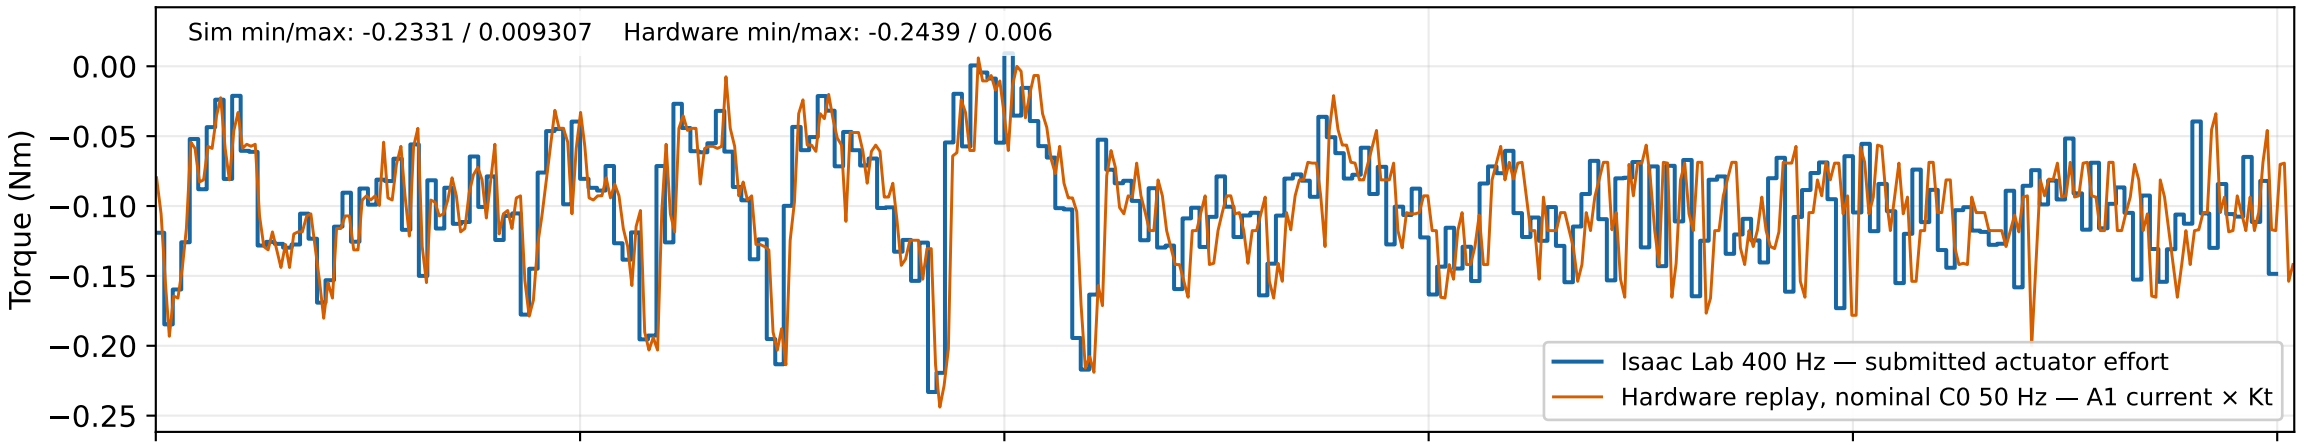

Torque: submitted simulation effort versus current-derived hardware estimate, before passive losses.
Position: full turns from each startup zero; not rebased at core start. Physical wheel starting angle was not matched between runs.

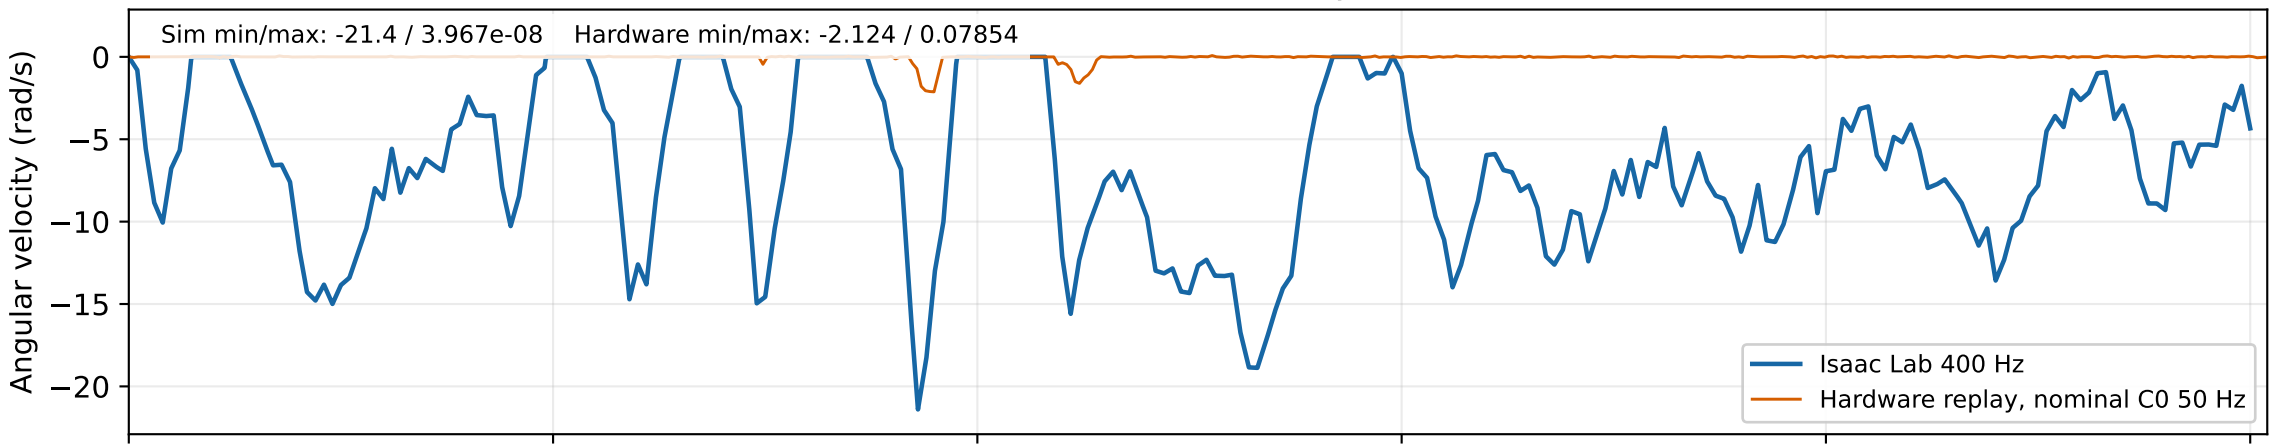

Rear wheel: simulation versus replay 2 — 2026-10-29 15:27:44

Same ordered model_2500 torque targets · source episode 12.5–17.5 s
Airborne hardware, nominal C0 50 Hz (49.60 Hz measured) · saved nominal fixed-base Isaac400
Core duration: simulation 5.000 s; hardware 5.040 s · no fitted delay or time rescaling

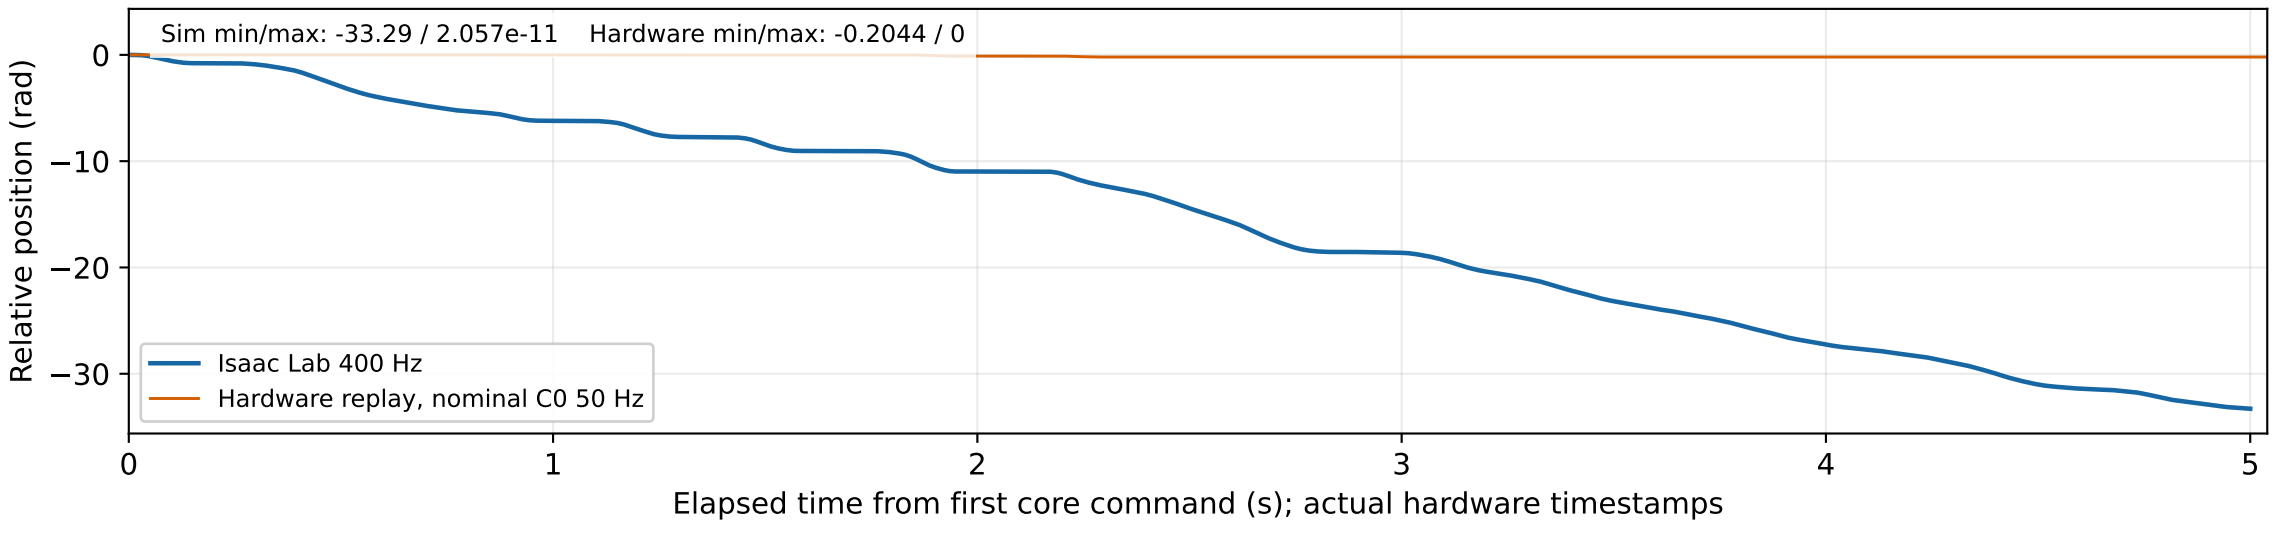

Actuator torque before passive friction

Rear-wheel velocity

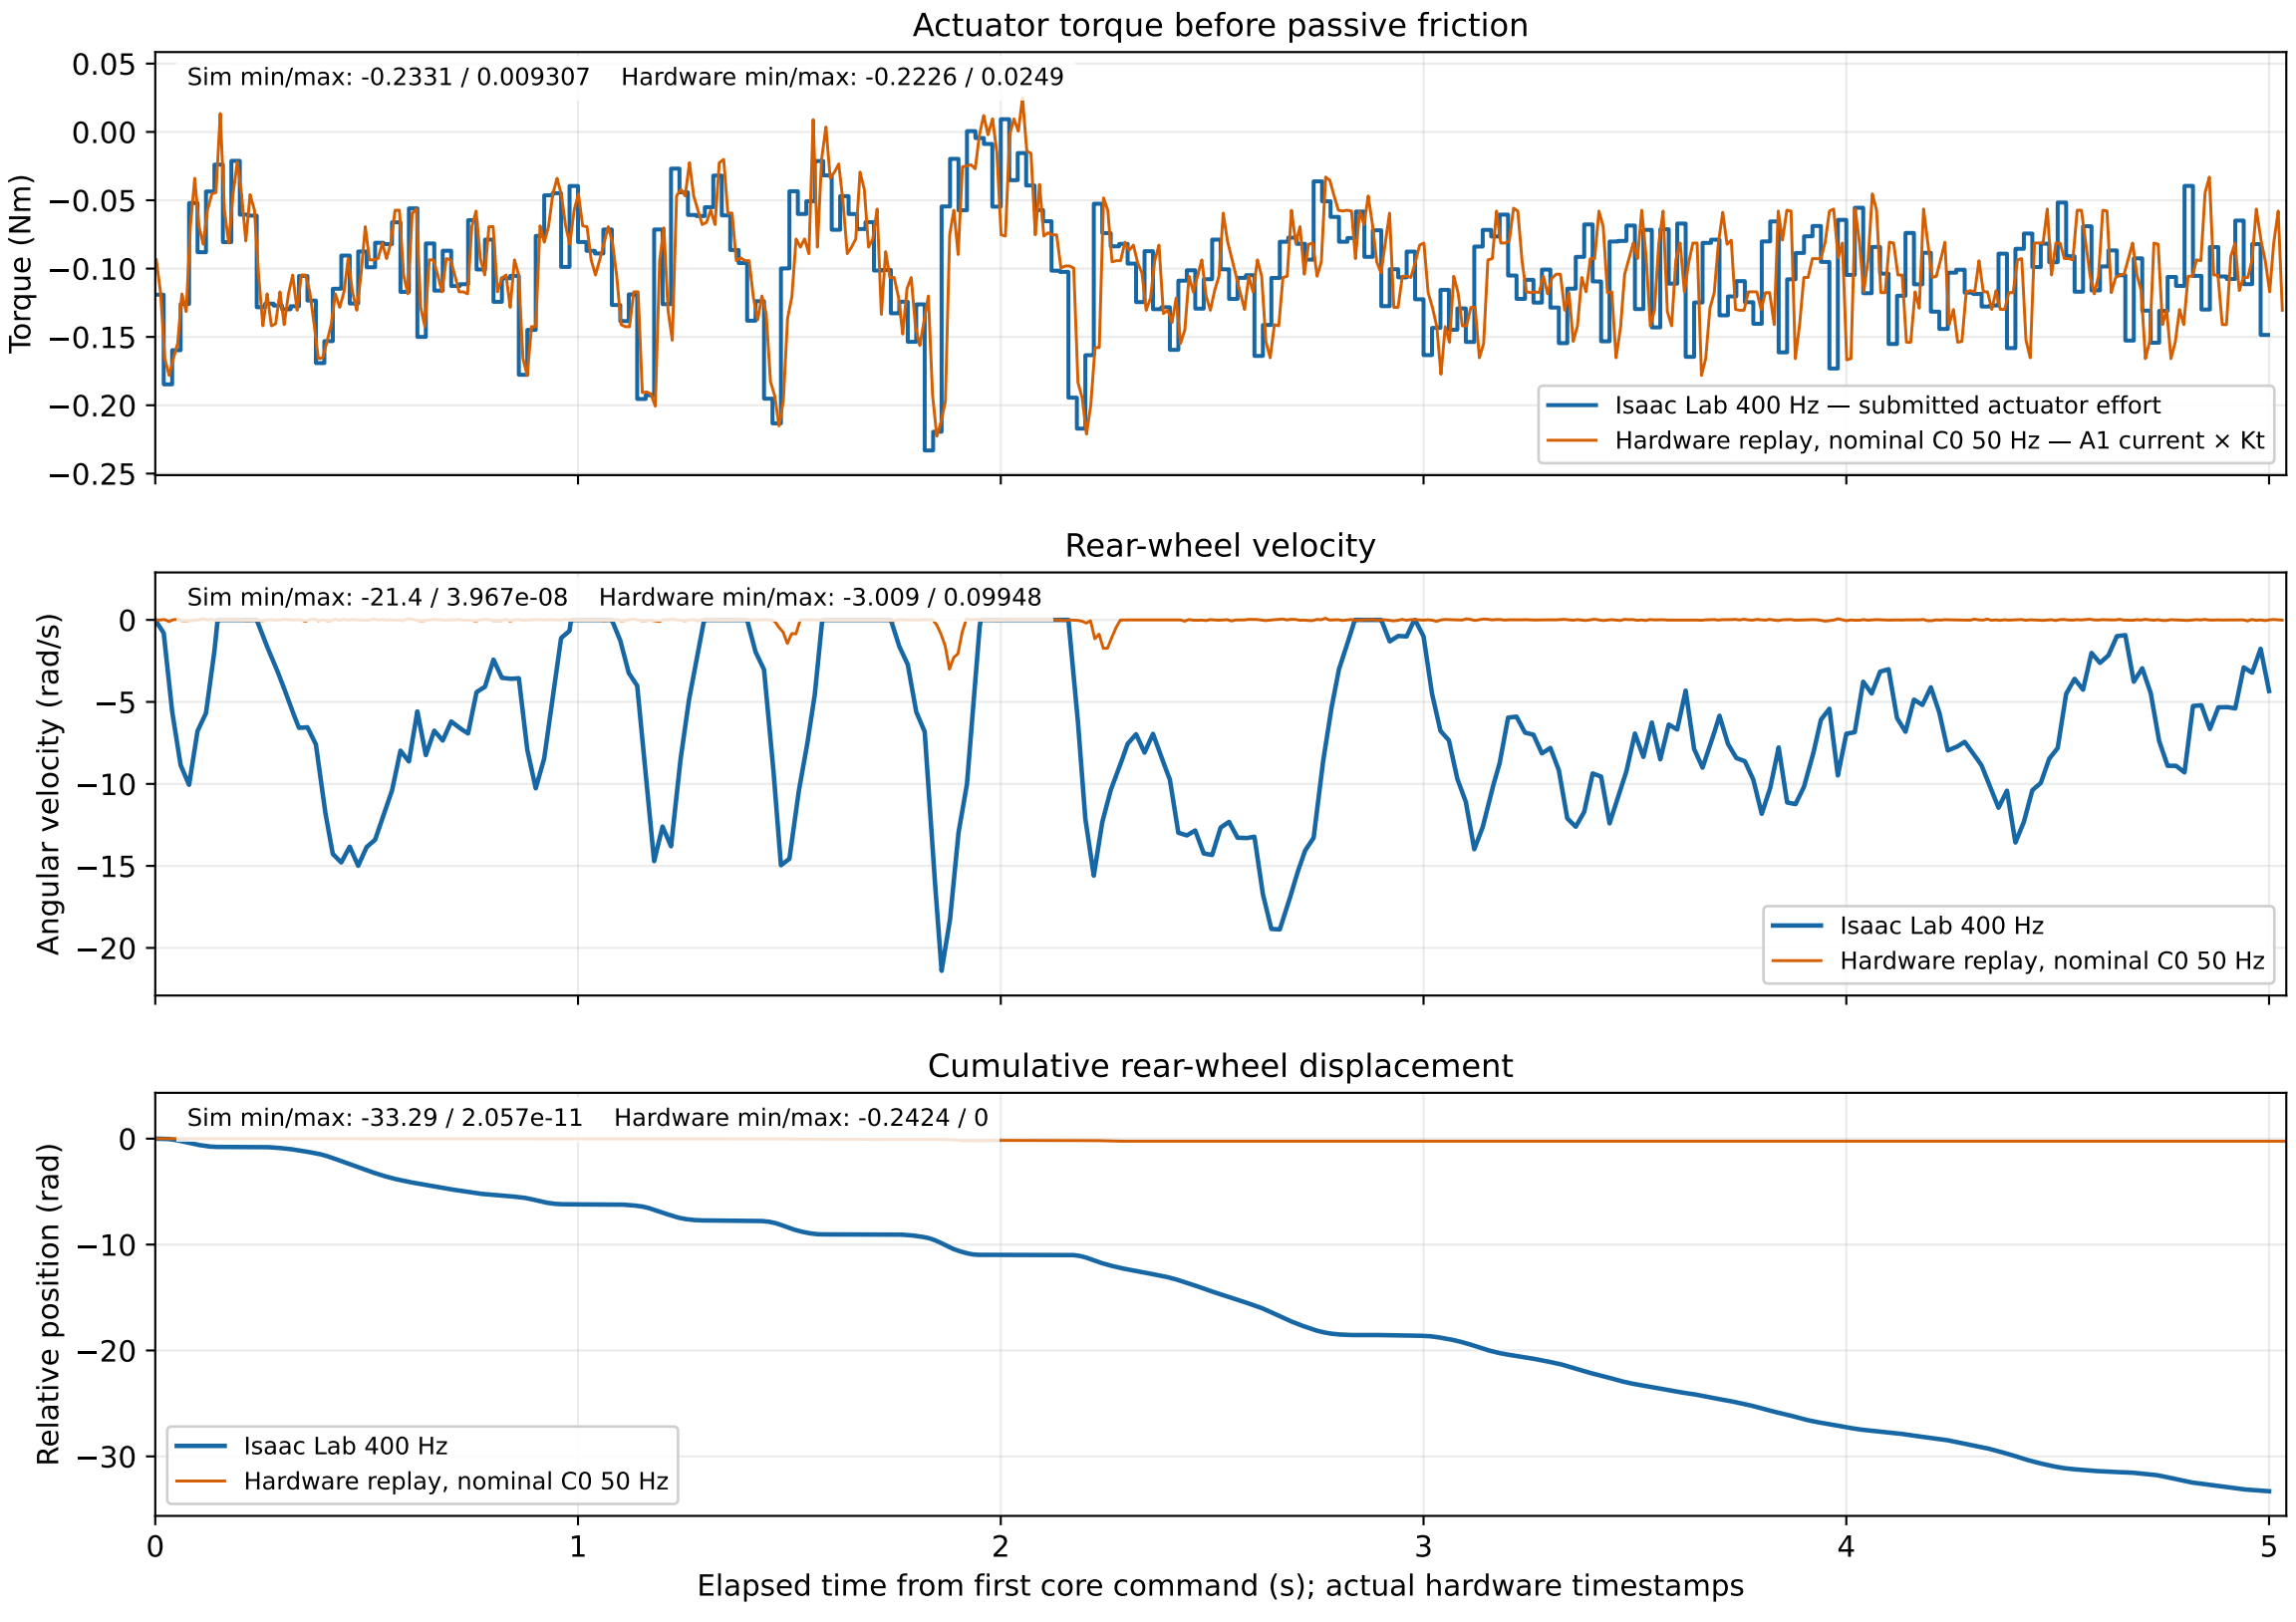

Cumulative rear-wheel displacement

Torque: submitted simulation effort versus current-derived hardware estimate, before passive losses.
Position: full turns from each startup zero; not rebased at core start. Physical wheel starting angle was not matched between runs.

Rear wheel: simulation versus replay 3 — 2026-10-29 15:28:04

Same ordered model_2500 torque targets · source episode 12.5–17.5 s
Airborne hardware, nominal C0 50 Hz (49.60 Hz measured) · saved nominal fixed-base Isaac400
Core duration: simulation 5.000 s; hardware 5.041 s · no fitted delay or time rescaling

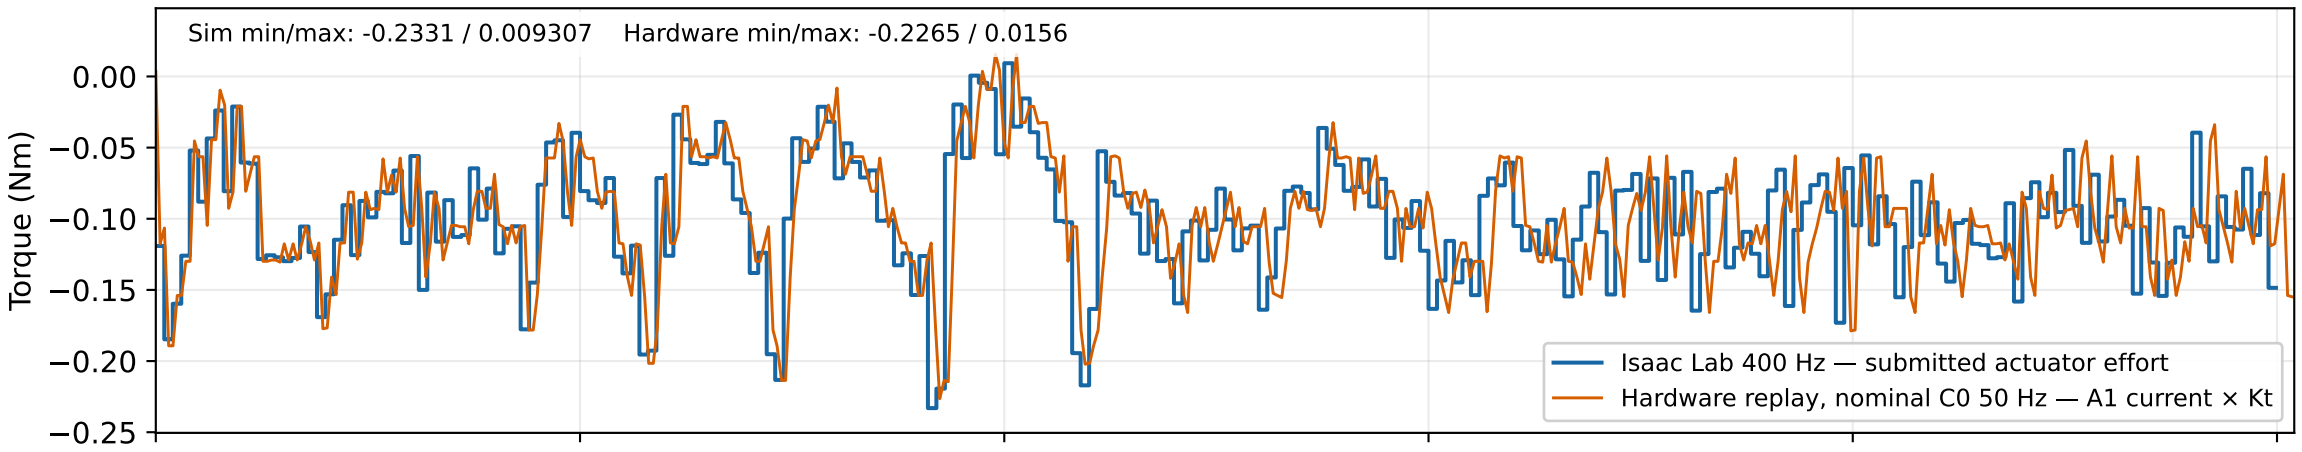

Torque: submitted simulation effort versus current-derived hardware estimate, before passive losses.
Position: full turns from each startup zero; not rebased at core start. Physical wheel starting angle was not matched between runs.

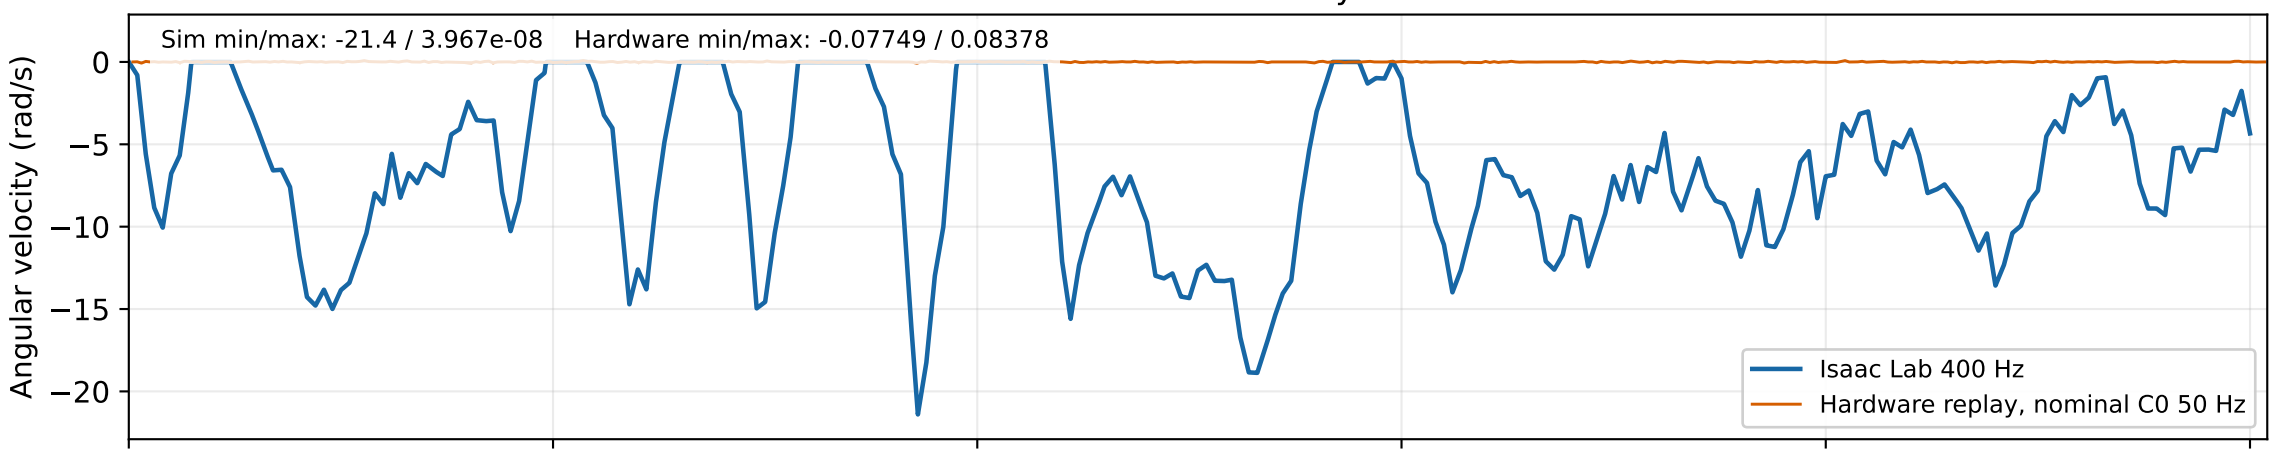

Rear wheel: simulation versus replay 4 — 2026-10-29 15:28:22

Same ordered model_2500 torque targets · source episode 12.5–17.5 s
