Isaac Lab · model_91850 · demand versus measured response
No DR · env 0
Full DR · env 0
Scaled raw policy demand
Target submitted to PhysX
Actual simulated steering angle
Solver-measured joint-axis effort
Steering position (deg)
Rear joint torque (N·m)
Evaluation time (s; vertical dotted lines mark resets)
Symmetric-log y axes retain startup spikes. 50 Hz policy / 400 Hz physics and measurement · seed 42
Blue and orange overlap: submitted targets are not Python-clipped. Rear green is joint-axis effort, not the clipped ImplicitActuator estimate.
