Policy output → final motor request → measured response

Model 91850 | Corrected rear encoder sign | 2026-10-12 18:06 recording

Requests: decoded MIT/C0 payload equivalents on successful-send ticks, after all host limits. Response: published A3 position and measured Q-axis current × B0 torque constant.

Recorded timestamps; no lag correction or smoothing. Common scales within each row; request/response rows use identical scales. Gaps >50 ms are broken; 30 ms feedback tail.

Command limits were ENABLED in this bag. Rear torque is NOT an independent shaft-torque measurement. Kickstand support occurred <1 s after lift (user report); exact contact time unknown.
